

APHID ALERT SUMMARY

This alert summarises up-to-date results from the Rothamsted/SASA suction-trap (ST) network and the FERA yellow water-pan trap (YWT) network. Further details of the ST results can be found below and further details of the YWT results can be found at www.potato.org.uk/online-toolbox/aphid-monitoring.

GENERAL

Aphid flight activity has increased significantly this week as the weather gradually improved. The trap catches continue to be dominated by the willow-carrot aphid (*Cavariella aegopodii*) and the leaf-curling plum aphid (*Brachycaudus helichrysi*), with numbers of the damson-hop aphid (*Phorodon humuli*) also now building.

CEREALS

Cereal aphids are flying throughout the country this week, but numbers generally remain low. Both winter and spring crops are past the stage at which further BYDV infection would be an issue, except possibly for some late crops in Scotland which have not yet reached the stage (GS31).

POTATOES

Virus pressure was high in England, particularly in East Anglia and Northern England. Large numbers of the peach-potato aphid (*Myzus persicae*) have been caught in these regions, but the willow-carrot aphid (*Cavariella aegopodii*) and the leaf-curling plum aphid (*Brachycaudus helichrysi*) are generally responsible for most of the virus pressure.

Numbers of the peach-potato aphid (*Myzus persicae*) have increased through East Anglia, central and southern England, and have been caught as far north as Edinburgh in the suction-traps.

The potato aphid (*Macrosiphum euphorbiae*) has been caught in low numbers throughout England this week.

The black bean aphid (*Aphis fabae*) is a good vector of PVA and is also now flying throughout central, eastern and southern England. Cereal aphids are now flying throughout the country but in very low numbers at this stage. Further regional information on potato virus vectors can be accessed here: www.potato.org.uk/online-toolbox/aphid-monitoring.

OILSEED RAPE

Numbers of mealy cabbage aphids (*Brevicoryne brassicae*) have increased this week, particularly in central England. In winter oilseed rape the threshold for control is >13% plants infested before petal fall, but most crops are now beyond this stage. In spring rape the threshold for control is >4% plants infested before petal fall.

FIELD BRASSICAS and LEAFY VEGETABLES

Numbers of the peach-potato aphid (*Myzus persicae*) are highest in eastern England, coinciding with field reports from young brassicas. Numbers of mealy cabbage aphids (*Brevicoryne brassicae*) have increased this week, particularly in central England.

CARROTS

Numbers of the willow-carrot aphid (*Cavariella aegopodii*) flying have again increased this week, and were highest in southern, central and eastern England.

PEAS and BEANS

Pea aphid (*Acyrtosiphon pisum*) and the black bean aphid (*Aphis fabae*) are flying in low numbers, with field reports of both respectively in peas and beans in central and eastern England and East Anglia.

SUCTION-TRAPPING RESULTS

Suction-trap sites

The information below relates to suction-trap samples collected during Bulletin Week 9: 01/6 – 07/6. The weather this bulletin week was several degrees warmer and aphid numbers in the suction-traps have significantly increased in response.

- The cereal aphid hotspot at Starcross has continued, but elsewhere cereal aphid numbers are low.
- Numbers of the peach–potato aphid (*Myzus persicae*) are building with highest numbers in eastern England.
- The potato aphid (*Macrosiphum euphorbiae*) was caught at eight sites this week in low numbers.
- Field reports indicate both peach–potato aphid and potato aphid in potatoes in Essex.
- Numbers of the willow–carrot aphid (*Cavariella aegopodii*) have increased at 12/14 sites this week, with highest numbers in eastern England.
- The mealy cabbage aphid (*Brevicoryne brassicae*) was caught at eight sites this week, with a first arrival at Wye (3/6). There were hotspots at Wellesbourne (63), Kirton (35) and Writtle (28).
- The pea aphid (*Acyrtosiphon pisum*) was caught at seven sites this week, with a first arrival at Hereford (5/6), and a hotspot at Starcross (18), plus field reports of pea aphids in Kent and some PGRO field trials.
- The black bean aphid (*Aphis fabae*) has been caught at six sites this week, with field reports from beans and courgettes in Kent and Warwickshire.
- A single currant-lettuce aphid (*Nasonovia ribisnigri*) was caught at Kirton (1/6).

The tables below show current and accumulated totals with comparisons to previous years. ‘/’ indicates that identifications have not been completed and ‘*’ indicates where totals have been corrected proportionally to seven days, fewer days’ samples having been identified.

Rose–grain aphid (*Metopolophium dirhodum*)

Rose–grain aphid (<i>Metopolophium dirhodum</i>)	Bulletin Week Totals 01/06-07/06				Accumulated until 07/06
